

PokeValue - Pricing Model Factor Report

Generated 2026-07-25

How the model works

Every card's fair value is computed as: **base rate x Pokemon factor x rarity factor x illustrator factor x set factor x card type factor**. Each factor is independent of the others - a Pokemon's factor doesn't depend on which rarity the card happens to be, and vice versa. This is a log-linear (ridge) regression fitted on 19,255 English-language cards with a real Cardmarket price, covering every set on TCGdex.

Model accuracy, on the sets actually shown on the site (held-out Scarlet & Violet / Mega Evolution cards):

R-squared = 0.933 (the model explains 93% of the price variation between cards), median prediction error 33%. This is the number that matters for what you actually see on pokevalue.cards.

For reference, accuracy on the full held-out set (2,889 cards, 14,610 of the 19,255 training rows come from sets not shown on the site — see README): R-squared = 0.896, median prediction error 37%. Training rows from non-displayed sets are down-weighted (0.4x vs. 1.0x) rather than dropped, so the fit still borrows their statistical support for sparsely-represented Pokémon and illustrators without letting older, more condition-blended prices pull the site's own numbers off target.

How to read the confidence columns

n cards is how many priced cards support that specific factor. **95% CI** is a bootstrap confidence interval (60 resamples) - the range the true factor plausibly falls in; a wide range means the point estimate is shaky. Anything with fewer than 5 supporting cards is flagged **low confidence** - on the live site, those factors are additionally pulled most of the way back toward neutral (1x) so a single freak card can't dominate a shown price. The numbers in this report are the raw, undamped statistical estimate.

Not included in this model: reverse holo / 1st Edition / Shadowless pricing (Cardmarket's variant-level data was too inconsistent to trust yet) and manual artwork-quality ratings (descope for this version). Condition and language remain adjustable on the site but are reasonable assumptions, not computed from data - Cardmarket doesn't track prices separately by grade or by language.

Rarity factors

30 distinct rarities.

Value	Factor	n cards	95% CI	Flag

Rarity x Era factors

61 distinct rarity/era combinations. Layered on top of the plain rarity factor above: a rarity tier means something very different depending on when the card was printed (median Rare/Common price ratio: 32.6x for WOTC-era cards vs. 2.3x for SV+ cards) - this factor corrects for that shift.

Card type x Era factors

34 distinct card type/era combinations. Layered on top of the plain card type factor above, same reasoning as Rarity x Era: old "EX" (2003-2010) and new "ex" (2023+) get normalized into one cardType bucket since TCGdex's casing doesn't reliably tell them apart, but they're priced very differently (median EUR64.62 vs. EUR1.88).

Card name factors (Trainer / Energy)

1435 distinct Trainer/Energy card names (plus the n/a baseline for Pokemon cards, whose identity is already covered by the Pokemon factor above). Most names are one-off reprints with too little data to say anything - shrinkage pulls those to neutral, same as anywhere else in this report.
