

PokeValue - Pricing Model Factor Report

Generated 2026-07-30

How the model works

Every card's fair value is computed as: **base rate x Pokemon factor x rarity factor x illustrator factor x set factor x card type factor**. Each factor is independent of the others - a Pokemon's factor doesn't depend on which rarity the card happens to be, and vice versa. This is a log-linear (ridge) regression fitted on 19,255 English-language cards with a real Cardmarket price, covering every set on TCGdex.

Model accuracy, measured the way the site is actually used: median error against the Cardmarket *trend* price (the number shown on every card page), on the 4,379 cards from the displayed sets, cross-validated so no card is scored by a model that saw it. **Median error 28%**; 38% of cards land within 20% of their market price.

That single median hides a lot, so it is also broken out by price: EUR0-0.3: 25% (n=2,714), EUR0.3-3: 30% (n=698), EUR3-30: 32% (n=769), EUR30+: 42% (n=198). Over half of all cards trade under EUR0.30, where Cardmarket's EUR0.01 price steps alone put a floor on the achievable error - so the overall median is dominated by cards nobody looks up, and the expensive end is where the model is genuinely hardest.

A Pokemon's popularity premium is not a constant multiplier: fitted on the data, it applies 1.31x as strongly on mid-tier cards and 1.68x as strongly on chase cards (illustration/special illustration/hyper/shiny rares) as it does on bulk cards. Training rows from the 14,876 cards in sets not shown on the site are down-weighted (0.2x vs. 1.0x) rather than dropped - enough to keep sparsely-represented Pokemon and illustrators estimable, without letting them pull the displayed sets' own numbers off target.

How to read the confidence columns

n cards is how many priced cards support that specific factor. **95% CI** is a bootstrap confidence interval (60 resamples) - the range the true factor plausibly falls in; a wide range means the point estimate is shaky. Anything with fewer than 5 supporting cards is flagged **low confidence** - on the live site, those factors are additionally pulled most of the way back toward neutral (1x) so a single freak card can't dominate a shown price. The numbers in this report are the raw, undamped statistical estimate.

Not included in this model: reverse holo / 1st Edition / Shadowless pricing (Cardmarket's variant-level data was too inconsistent to trust yet) and manual artwork-quality ratings (descope for this version). Condition and language remain adjustable on the site but are reasonable assumptions, not computed from data - Cardmarket doesn't track prices separately by grade or by language.

Rarity factors

35 distinct rarities.

Rarity x Year factors

202 distinct rarity/year combinations. Layered on top of the plain rarity factor above: a rarity tier means something very different depending on when the card was printed (median Rare/Common price ratio: 32.6x for WOTC-era cards vs. 2.3x for SV+ cards) - this factor corrects for that shift.

Value	Factor	n cards	95% CI	Flag

Card type x Year factors

91 distinct card type/year combinations. Layered on top of the plain card type factor above, same reasoning as Rarity x Year: old "EX" (2003-2010) and new "ex" (2023+) get normalized into one cardType bucket since TCGdex's casing doesn't reliably tell them apart, but they're priced very differently (median EUR64.62 vs. EUR1.88).

Card name factors (Trainer / Energy)

1435 distinct Trainer/Energy card names (plus the n/a baseline for Pokemon cards, whose identity is already covered by the Pokemon factor above). Most names are one-off reprints with too little data to say anything - shrinkage pulls those to neutral, same as anywhere else in this report.

Value	Factor	n cards	95% CI	Flag
