

PokeValue - Pricing Model Factor Report

Generated 2026-07-24

How the model works

Every card's fair value is computed as: **base rate x Pokemon factor x rarity factor x illustrator factor x set factor x card type factor**. Each factor is independent of the others - a Pokemon's factor doesn't depend on which rarity the card happens to be, and vice versa. This is a log-linear (ridge) regression fitted on 19,255 English-language cards with a real Cardmarket price, covering every set on TCGdex.

Model accuracy (on 2,889 cards held out of training): R-squared = 0.884 (the model explains 88% of the price variation between cards), median prediction error 39%. This is comparable to a neural-network version of the same model tried earlier, but every number below is directly interpretable instead of hidden inside the network.

How to read the confidence columns

n cards is how many priced cards support that specific factor. **95% CI** is a bootstrap confidence interval (60 resamples) - the range the true factor plausibly falls in; a wide range means the point estimate is shaky. Anything with fewer than 5 supporting cards is flagged **low confidence** - on the live site, those factors are additionally pulled most of the way back toward neutral (1x) so a single freak card can't dominate a shown price. The numbers in this report are the raw, undamped statistical estimate.

Not included in this model: reverse holo / 1st Edition / Shadowless pricing (Cardmarket's variant-level data was too inconsistent to trust yet) and manual artwork-quality ratings (descope for this version). Condition and language remain adjustable on the site but are reasonable assumptions, not computed from data - Cardmarket doesn't track prices separately by grade or by language.

Rarity factors

30 distinct rarities.

Value	Factor	n cards	95% CI	Flag
Black White Rare	x55.08	4	9.55-97.77	low confidence

Card name factors (Trainer / Energy)

1489 distinct Trainer/Energy card names (plus the n/a baseline for Pokemon cards, whose identity is already covered by the Pokemon factor above). Most names are one-off reprints with too little data to say anything - shrinkage pulls those to neutral, same as anywhere else in this report.
